

ABSTRACT

The present invention relates to a composition for making up keratin fibres, especially the eyelashes, which has the following features:

- a solids content defined by a dry solids extract of more than 45% of the total weight of the composition; and
- an adhesion profile ≤ 2.5 , the said adhesion profile representing the ratio of the adhesive power when 20% of the said composition has evaporated ($PA_{20\%}$) to the adhesive power at T_0 (written PA_{T_0} , T_0 corresponding to the time at which the composition is applied).

This composition thus makes it possible to combine a high dry solids extract with a specific adhesion profile so as to enhance the volumizing effect of the said composition.
